0107571 Internet Programming Assignment 5: Dynamic Loading of a Web Page by Interaction between Client and PHP Server

Department of Computer and Communications Engineering
Tafila Technical University

1 Assignment

You need to do the following:

1. As your mouse move over any of the items, the mouse pointer should be changed to some other forms.
2. Each item is clickable.
3. For the first item I am providing you with a JSON array for the elements as follows:

```
[{"name":"Fried","description":"Fried chiken is very deleciuos and very light on stomac"},
{"name":"boiled","description":"Boiled chiken is very healthy however it is not that tatsty."},
{"name":"Grilled","description":"On top of a coal fire that is very hot this
kind is cooked and added to it a hot spices"},
{"name":"Alfredo","description":"This is the easiest, creamiest chicken alfredo you will ever make."},
{"name":"Lemon Pepper Chicken","description":"This lemon pepper chicken makes chicken exciting again."},
{"name":"Roast","description":"You need this classic recipe in your arsenal."},
{"name":"Biryani","description":"Chicken biryani is such an easy and
delicious dinner. Served over fluffy white rice, it's hard to resist."},
{"name":"Tamale Pie","description":"A layer of cornbread topped with cheesy shredded chicken."}]
```

4. You need to design a database that contains the info above about the items. The provided one and the other two.
5. Your client code should ask the server code which is in php about the elements you need. The server prepare the response.
6. Your code will receive the response serialized and show the data on the page.
7. Note that you should have a template for the items shown as explained in the class.
